DNA encoding plant citrate synthase - used to regulate flower formation, to improve storage of tubers, etc. and to reduce sprouting Claim 7: Page 60-63: 8Tpp: English.

Claim 7: Page 60-63: 8Tpp: English.

Claim 7: Page 60-63: 8Tpp: English.

Synthase, a cDNA from tobacco which codes for citrate synthase, a cDNA bank of leaf tissue from tobacco was prepd. Plaques of this cDNA bank were screened using a radioactive DNA probe which comprises Solanum tuberosum citrate synthase cDNA (104199). One of the clones was sequenced. The nt. sequence is given in T04201.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA encoding plant citrate synthase - used to regulate flower formation, to improve storage of tubers, etc. and to reduce sprouting Claim 6: Page 57-60: 87pp. English.

To identify a cDNA from sugar beet which codes for citrate synthase, a cDNA bank of leaf tissue from sugar beet was prepd. Plaques of this cDNA bank were screened using radioactive DNA probes which comprise a mixture of Solamum tuberosum citrate synthase cDNA (104199) and Nicotian tabacum citrate synthase cDNA (see T04201). One of the clones was sequenced. The nt. sequence is

Introducing random point mutations into nucleic acods -
los prepn of single stranded template, annealing a primer, elongation, misincorporation, completion of molecules and screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          C; Gaps
                                                                                                                                                                                                                                                                               E.coli beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the
                                                                                                                                                                                                                                                                                                                                                                                                       transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which occurred singularly in any given mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure; p; English.

Random point mutations were introduced into the alpha fragment of E.coli beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to lit to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oligonucleotide probe MX14-A consists of nucleotides 5-95 or MX14 (Q51735). It hybridized to all spp. of mycobacteria tested, but cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                                                           ;

                                                    Oligonuclectide probe MK14.A consists of nucleotides 5-95 of (051735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also (051735-45 and 051747-59.

Translight of process of peptide(s) which bind a lighalor by screening a recombinant vector library expressing fusion proteins Disclosure; Page 35, 25pp; English.

Comprising a binding domain and an effector domain proteins Disclosure; Page 35, 25pp; English.

Comprising a binding domain and an effector domain proteins of 270465 is a generic DNA sequence used to generate random TSAR (Totally Comprised as follows: X(NNB) [GGC] (NNB) 12 (NNB) 14 (TGC] (NNB) 37. X and Y are flanking restriction sites (X is not the same as Y) that are not specific peptides generated by these generic sequences are shown in Comprising at least two functional regions - a binding domain with a ffinity for a ligand and a second effector peptide portion that is chanically or biologically active. They may further comprise a linker of peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues societ that the expressed peptide contains 2 or 4 cysteine residues societ comprises or comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eq. metal ion, a radioisotope, peptide, toxin or enzyme, to the specific target or on the composition. They can also replace the function of macromoleules, eq. metal ion, and complex methods of hybridoma formation or in vivo antibody concluding direct and rapid detection in a screening process. Sequence 114 BP; 0 A; 2 C; 2 C; 2 T;

Tribular Notations or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comparising a binding domain and an effector domain proteins by binding domain and an effector domain proteins of binding domain and an effector domain proteins of bisclosure; page 35; 255pp; English.

20 070467 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagen's) peptides. This generic formala can also be represented as follows: X(NNB)16(TGC)(NNB)16(TGC)(NNB)18. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q70466-68. Other specified further other generated by these generic sequences are shown in R5151-54. TSARs are concatenated heterotunctional proteins or peptides, comprising at least two functional regions - a binding domain with R5151-54. TSARs are concatenated heterotunctional proteins or peptides, comprising at least two functional regions - a binding domain with a finity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking a TBARS binding domain residues. There residues confer some degree of conformational rigidity to the peptides. The TSARS and allows and protein and be used in vivo to deliver a chomically or biologically active in a manner of the compans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    deliver a chemically or biologically active moiety, eg. metal ion, radiolostope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing

or compans. Comparising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eq. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eq. monoclonal or polyclonal antibodies and therefore circumvent the need
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0;

CC 07469 is a generic DNA Sequence used to generate random TSAR peptide
This generic formula can be represented as follows: X(TSC)(NNB)10-
CC (TGC)(NNB)2(TGC)(NNB)14(TGC)Y. A and Y are flanking restriction
sites (X is not the same as Y) that are not specified further. This sequence generates peptides that are cloverleaf in structure. Other
CC (TGC)(NNB)2(NNB)2(TGC)(NNB)14(TGC)Y. A and Y are flanking restriction
sites (X is not the same as Y) that are not specified further. This sequence generic sequences are shown in Q70465-68. Other specifies peptides
CC generic sequences are shown in Q70465-68. Other specifies proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains.
CC contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues positioned in, or flanking, the conformational rigidity to the peptides. The TSARs or compone conformation in rigidity to the peptides. The TSARs or compone conformation or mostly active moiety, es, metal ion, radioisotope, peptide, toxin to a TSAR binding domain can be used in vivo to deliver a chemically or biologically and therefore circumvent the need for complex methods of hybridoma or in vivo antibody production. The TSARs are easily conformed and have designed activity allowing direct and rapid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             06-007-1998 (first entry)
Mammalian DNA replication origin consensus sequence, uniorsconsensus.
DNA replication origin; human; mammal; alphaconsensus; uniorsconsensus; anti-gene; DNA replication inhibitor; shuttle vector construct creation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     321 IGTCATTCCTCTCATTCCACCAAGAACCATATCAACTGTGATGTTCCCAATTGAACCTTT 262

This sequence represents a human or mammalian DNA replication origin consensus sequences of the invention, designated uniorsconsensus.

Administration of the consensus sequence or an anti-gene (comprising a double stranded copy of the consensus) is used to inhibit DNA replication in vivo or in vitro. The consensus sequences can also be inserted into an expression vector, used subsequently for in vitro transfection of mammalian cells, to control initiation of DNA replication. They can also be used used to maintain circular plasmids that are capable of semi-conservative replication in proliferating mammalian cells, or inserted into amammalian or human artificial chromosome vectors for gene therapy. Particularly, they are used to create shuttle vector constructs for defining the essential mammalian elements required for maintenance of chromosomal function. The consensus sequence can be combined with cloned human relomeres and large centromeric blocks for assembly of human artificial chromosomes and maintained as bacterial plasmids, circular or linear, large or small yeast artificial chromosomes (YACS) or as episomal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a human or mammalian DNA replication origin consensus sequence of the invention, designated uniorsconsensus. Mean 33.654; Variance 162.896; scale 0.207 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

### ALIGNMENTS

```
Inhibiting citrate synthase (CS) activity in plants - to inhibit flower formation and improve storage capacity, e.g. in potatoes, a lso new CS sense and anti-sense DNA sequences.

Talso new CS sense and anti-sense DNA sequences.

Claim 5; Page 15-19; 35pp; German.

The potato citrate synthase (CS) gene or cDNA sequence encoding CS (T03410) may be used to produce antisense CS sequences. CS DNA csequences are useful for altering CS activity in plants. Antisense CS sequences can be used to inhibit CS expression in plants and has the effect of inhibiting flower formation and by doing so improves the plant's storage capacity. This is partic. useful in crop plants of any kind but esp. useful in potatoes. In addition to altering CS activity the DNA sequences can also be used to identify similar sequences in the genomes of other plants and in the production of transgenic plants with altered CS activity. This sequence

represents the amino acid sequence of potato citrate synthase.

DNA encoding plant citrate synthase - used to regulate flower formation, to improve storage of tubers, etc. and to reduce sprouting Disclosure; Page 60-63, 87pp; English.

To identify a cDNA from tobacco which codes for citrate synthase, a cDNA bank of leaf tissue from tobacco was prepd. Plaques of this cDNA bank were screened using a radioactive DNA probe which comprises Solamm tuberosum citrate synthase cDNA (T04199). One of the clones was sequenced. The nt. sequence is

Disclosure: Fig 5: 12pp. Japanese The aarA gene encodes the citrate synthase and is part of an acetic acid resistance operon comprising aarA, aarB and aarC. The DNA can be used to prepare an acetic acid resistant strain bacteria for use in acetic acid fermentation.

Synthase, a cDNA from sugar beet which codes for citrate synthase, a cDNA bank of leaf tissue from sugar beet was prepd. Plaques of this cDNA bank were screened using radioactive DNA probes which comprise a mixture of Solanum tuberosum citrate synthase cDNA (T04199) and Nicotian tabacum citrate synthase cDNA (see T04201). One of the clones was sequenced. The nt. sequence is given in T04200.

Claim 2; Page 34; 50pp; Japanese.

This represents the amino acid sequence of a Acetobacter xylinum subspecies sucrefermentans bcsA gene product. The invention provides a gene encoding a Acetobacter xylinum subspecies sucrefermentans derived cellulose synthesis complex produced protein. The gene sequence represents bcsA, bcsB, bcsC or bcsD, CMCase and a beta-glucosidase encoding gene. The novel gene and the enzyme participate in the synthesis of cellulose by microorganisms. Cells transformed with the genes may be sequence 754 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ŝ

The sequences given in R45000-03 represent the proteins encoded by The sequences given in R45000-03 represent the proteins encoded by the bacterial cellulose synthase operon. The sequence given in R45004 is the begining of an open reading frame overlapping the end of this operon. The bacterial cellulose synthase operon contains four genes, genes A-D. The operon sequence may be used in a transcription vector for the expression of the cellulose synthase operon to increase cellulose production in a recombinant microorganism. This system may be used as an important tool for exploring mechanisms of cellulose synthesis and for enhancing production of cellulose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                155 SLIIMYTTIDALPVTAHPMTQFATGVMALQVQSEFQKAYEKGIHKSKYWEPTYEDSMNL- 213

DNA, vectors, transformed cells and antibodies, for diagnosis and treatment of neurological disorders, e.g. Parkinson disease Example 2; Page 114-115; 181pp; English.

The CDNA encoding the chromaffin granule amine transporter protein is useful in gene therapy and as a probe for detecting genomic sequences. The protein is used for screening cytotoxic compounds implicated in Parkinsons disease, diseases associated with activity of neurotoxins or psychiatric disorders and to identify compounds which selectively inhibit or activate its action. Antibodies raised against this protein are useful as immunoassay reagents for detecting the protein and as affinity reagents for purification. This fragment of the transporter protein shares homology with the Neterminal domains of the methlenomycin; tetracycline and multi-drug

This is the amino acid sequence of the mouse laminin A chain. The primary object of the invention is to use laminin, laminin-derived primary object of the invention is to use laminin, laminin-derived protein fragments and/or laminin-derived polypeptides as potent inhibitors of amyloid formation, deposition, accumulation and/or persistence in Alzheimer's disease and other amyloidoses. The laminin products (see W50888-98) may include mouse or human laminin A or Al chain, laminin Bl or B2 chain, laminin A2 chain (merosin), aminin G1 chain, the globular repeats of the laminin A1 chain and the becamploid binding domain of the laminin A chain A chaimed method for treating an amyloid disease comprises administering a polypeptide having a conformational similarity to a fragment of a laminin protein. A method for diagnosing an amyloid disease comprises administering of involves determining levels of laminin in a sample. Production of laminin or its fourth globular repeat in vivo provides a method for involves can be used for the diagnosis, prognosis, monitoring and treatment of amyloidoses such as Alzheimer's disease, Down's

polypeptide(s) - useful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection and for diagnosis of H. pylori infection and for diagnosis of H. pylori infection of the pylori brotein may be used in a vaccine to prevent or treat H. pylori protein polypeptide binding compounds, infection or to identify H. pylori plotpeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The DNA and probes derived from it may be used for the identification of H. pylori in a sample and the diagnosis of H. pylori infection. Nucleic and sequences complementary to the DNA act as antisense sequences and can be used to prevent the translation of H. pylori mRNA. Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori-specific antigens. The genomic sequence of H. pylori (ATC. 55479) was determined from overlapping contigs generated by mochanically shearing the bacterial DNA. The sequences were analysed for OR or ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF
infection and for diagnosis of H. pylori infection

This sequence is a H. pylori cytoplasmic protein involved in cofactor.

This sequence is a Protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The DNA and probes derived from it may be used for the identification of H. pylori in a sample and the diagnosis of H. pylori infection. Nucleic acid sequences complementary to the DNA act as antisense sequences and can be used to prevent the translation of H. pylori mRNA. Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of H. pylori-specific antigens. The genomic sequence of the pylori (ATCC 55679) was determined from overlapping contigs generated for DPP of at least 180 muclorides and the predicted coding regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 15-JUN-1998 (first entry)

Claim 12; Pages 342-344; 483pp; English.

This sequence represents a Streptococcus pneumoniae protein that, based on homology with an E. coil protein, is a methyl tetrahydropteroyitri glutamate-homocysteine methyltransferase, and is encoded by a DNA of the invention. The DNA sequences were isolated from S. pneumoniae strain 0100993 (NCIMB 40794). The Streptococcus pneumoniae proteins of the invention can be used to identify compounds which interact with and inhibit or activate the activity of the proteins. Antaqonists can be used to treat diseases caused by S. pneumoniae proteins, through genetic inmunisation. They can also be used to induce an immunological response in a mammal by inoculation with the S. pneumoniae proteins or delivery of the encoding nucleic acids in a vector adequate to produce antibody and/or I cell immune responses to protect the animal from disease. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     profeins can also be used to identify antimicrobial compounds which are capable of inhibiting their bioactivity. In particular the proteins of the invention can be used to prevent adhesion of bacteria to mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            extracellular matrix proteins on in-dwelling devices or in wounds, to block protein-mediated mammalian cell invasion, and to block the normal progression of pathogenesis in infections initiated other than by the implantation of in-dwelling devices or other surgical techniques.
were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   159 MYTTIDALPVJAHPMIOFATGVMALO-VOSEF--OKAYEKGIHKSKY-WEPTYEDSMNLI 214
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     249 vyadlvnlpvdaigl-dfvegkktlelvkggfpadktlyvgivngkniwrnnyekslavl 307
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Methyl tetrahydropteroyltriglutamate-homocysteine methyltransferase. Streptococcus pneumoniae protein; genetic immunisation; antagonist; immunological response; incoulation; antibody production; inhibitor; T cell immune response; antimicrobial compound; bacterial adhesion; extracellular matrix protein; protein mediated cell invasion, wound;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel Streptococcus pneumoniae proteins and related DNA - useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 101; DB 34; Length 456;

The first with insertion inactivated genes into environment and retrieval and analysis of mutants

Tetrieval and analysis of mutants

Claim 51; Figure 11; 319pp; English

Claim 51; Figure 11; 319pp; English

A method for identifying a microorganism having a reduced adaptation

to a particular environment comprising the steps of: (1) providing a plurality of microorganisms each of which is independently mutated by the insertional inactivation of a gene with a nucleic acid comprising a unique marker sequence so that each mutant contains a different marker sequence, or clones of the said microorganism; (2) providing individually stored nucleic acid comprising the unique marker sequence from each individual mutant; (3) introducing a providing individually stored nucleic acid comprising the unique marker sequence from each individual mutant; (3) introducing a convironment and allowing those microorganisms which are able to do so to grow in the said environment; (4) retrieving microorganisms from the said environment or a selected part thereof and isolating the nucleic acid from the retrieved microorganisms; (5) comparing any marker sequences in the nucleic acid isolated in step (4) to the marker sequences of each individual mutant stored as in step (2); and (6) selecting an individual mutant which does not contain any of the marker sequences as isolated in step (4). The products and and an individual mutant which does not contain and or the marker sequences of each individual mutant which does not contain and contain and contains a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2872 mrtixxrsrscherysms-lpdspl-qligilfilsilpl-iivmgtsflklavvfsilr 2928
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     of the marker sequences as isolated in step (4). The products and methods can be used for identifying virulence genes in microorganisms. The mutant microorganisms can be used in vaccines or to screen for drugs which reduce virulence or compounds useful for preventing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        :| :| :: :: ::| | : :: | | : : : | : : : : : : : ::| 358 LRKTVPRY-TCQREFAMKHLPEDPLFQLVSKLYEVFLLFLQNLAKLKPWPNVDAHSGVLL 416

##note the sequence from Fig. 2 is inconsistent with that from
Fig. 1 in having 47-Gly, 125-Trp, 141-Leu, 151-Ser,
185-Asn, 187-Asn, 191-Asn, 348-Leu, an additional Gly
after 89-Trp, an additional Val after 393-Cys and two
additional Arg after 228-Arg, in lacking 114-Leu and
residues 233 to 241
                                                                                                                        citrate (si)-synthase (EC 4.1.3.7) precursor, mitochondrial Arabidopsis thaliana
                                                                                                                                                                                                                                                                                                                               Unger, E.A.; Hand, J.M.; Cashmore, A.R.; Vasconcelos, A.C. Plant Mol. Biol. (1989) 13:411-418
Isolation of a cDNA encoding mitochondrial citrate synthase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120 GGLNHYRRSFVASLNWKGTL-AKSKLKH-CRKTWNRAAVSDYV-YNAIDALPSTAHPMTQ 176

##more
part of this sequence, including the amino end of the
mature protein, was confirmed by protein sequencing
IT his protein is involved in oral morphogenesis preceding binary
fission, and in nuclear events during fertilization, such as
formation of gametic pronuclei and zygote formation of gametic
pronuclei. It also acts as a mitochondrial enzyme, citrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Numata, O.; Takemasa, T.; Takagi, I.; Hirono, M.; Hirano,
